# **Using the Set Operators**

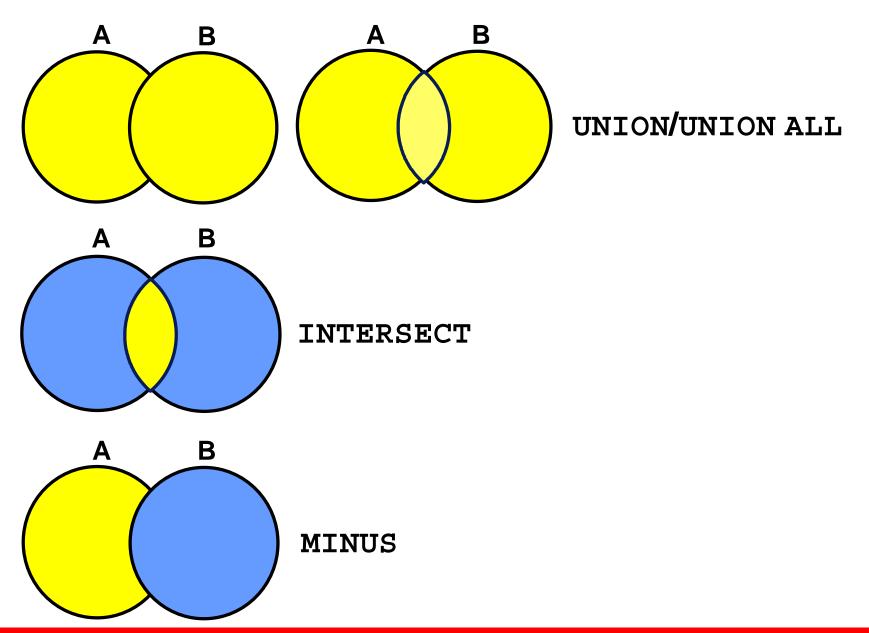

### **Objectives**

After completing this lesson, you should be able to do the following:

- Describe set operators
- Use a set operator to combine multiple queries into a single query
- Control the order of rows returned

- Set Operators: Types and guidelines
- Tables used in this lesson
- UNION and UNION ALL operator
- INTERSECT operator
- MINUS operator
- Matching the SELECT statements
- Using the ORDER BY clause in set operations

## **Set Operators**

#### **Set Operator Guidelines**

- The expressions in the SELECT lists must match in number.
- The data type of each column in the second query must match the data type of its corresponding column in the first query.
- Parentheses can be used to alter the sequence of execution.
- ORDER BY clause can appear only at the very end of the statement.

### The Oracle Server and Set Operators

- Duplicate rows are automatically eliminated except in UNION ALL.
- Column names from the first query appear in the result.
- The output is sorted in ascending order by default except in UNION ALL.

- Set Operators: Types and guidelines
- Tables used in this lesson
- UNION and UNION ALL operator
- INTERSECT operator
- MINUS operator
- Matching the SELECT statements
- Using the ORDER BY clause in set operations

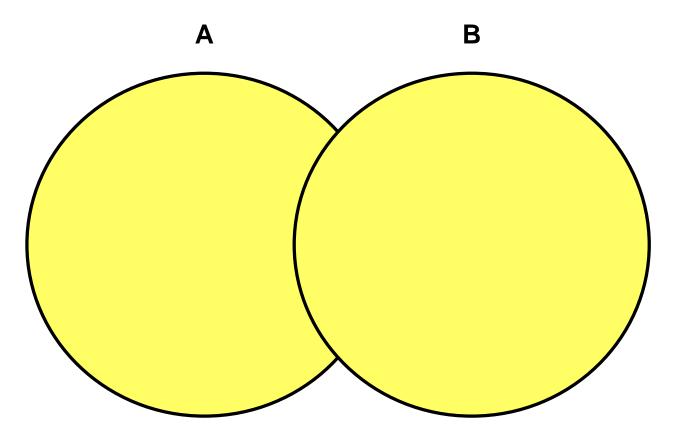

#### **Tables Used in This Lesson**

#### The tables used in this lesson are:

- EMPLOYEES: Provides details regarding all current employees
- JOB\_HISTORY: Records the details of the start date and end date of the former job, and the job identification number and department when an employee switches jobs

- Set Operators: Types and guidelines
- Tables used in this lesson
- UNION and UNION ALL operator
- INTERSECT operator
- MINUS operator
- Matching the SELECT statements
- Using the ORDER BY clause in set operations

#### **UNION Operator**

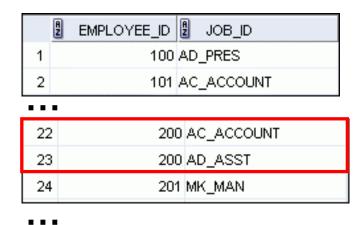

The UNION operator returns rows from both queries after eliminating duplications.

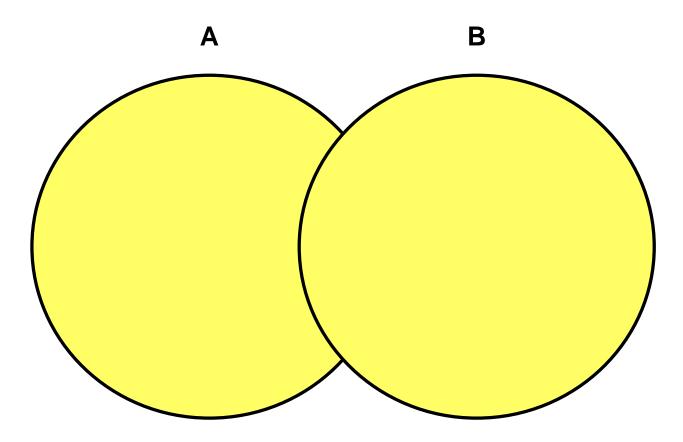

#### Using the UNION Operator

Display the current and previous job details of all employees. Display each employee only once.

```
SELECT employee_id, job_id
FROM employees
UNION
SELECT employee_id, job_id
FROM job_history;
```

#### **UNION ALL Operator**

The UNION ALL operator returns rows from both queries, including all duplications.

### Using the UNION ALL Operator

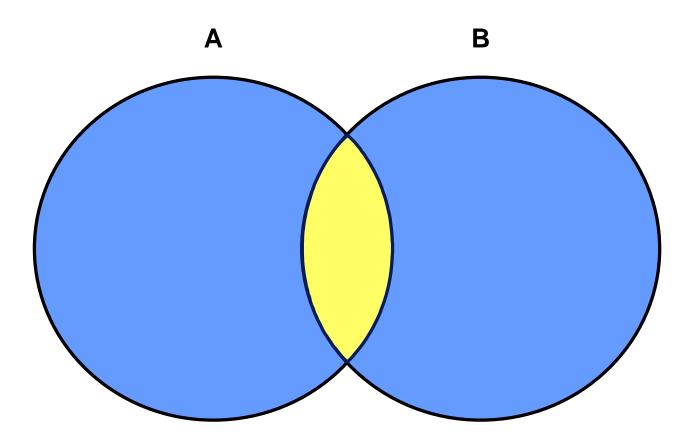

Display the current and previous departments of all employees.

```
SELECT employee_id, job_id, department_id
FROM employees
UNION ALL
SELECT employee_id, job_id, department_id
FROM job_history
ORDER BY employee_id;
```

	Ą	EMPLOYEE_ID	£	JOB_ID	A	DEPARTMENT_ID		
1		100	AD_	_PRES		90		
•••								
16		144	ST_	CLERK		50		
17		149	SA.	_MAN		80		
18		174	SA,	_REP		80		
19		176	SA,	_REP		80		
20		176	SA,	_MAN		80		
21		176	SA,	_REP		80		
22		178	SA.	_REP		(null)		
30		206	AC_	_ACCOUNT		110		

- Set Operators: Types and guidelines
- Tables used in this lesson
- UNION and UNION ALL operator
- INTERSECT operator
- MINUS operator
- Matching the SELECT statements
- Using ORDER BY clause in set operations

#### **INTERSECT Operator**

The INTERSECT operator returns rows that are common to both queries.

### Using the INTERSECT Operator

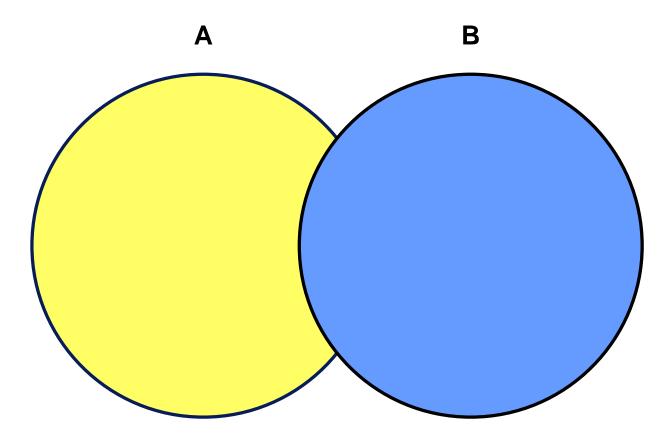

Display the employee IDs and job IDs of those employees who currently have a job title that is the same as their previous one (that is, they changed jobs but have now gone back to doing the same job they did previously).

```
SELECT employee_id, job_id
FROM employees
INTERSECT
SELECT employee_id, job_id
FROM job_history;
```

- Set Operators: Types and guidelines
- Tables used in this lesson
- UNION and UNION ALL operator
- INTERSECT operator
- MINUS operator
- Matching the SELECT statements
- Using the ORDER BY clause in set operations

#### MINUS Operator

The MINUS operator returns all the distinct rows selected by the first query, but not present in the second query result set.

#### Using the MINUS Operator

Display the employee IDs of those employees who have not changed their jobs even once.

```
SELECT employee_id
FROM employees
MINUS
SELECT employee_id
FROM job_history;
```

	EMPLOYEE_ID						
1	100						
2	103						
3	104						
4	107						
5	124						
•••							
14	205						
15	206						

- Set Operators: Types and guidelines
- Tables used in this lesson
- UNION and UNION ALL operator
- INTERSECT operator
- MINUS operator
- Matching the SELECT statements
- Using ORDER BY clause in set operations

#### Matching the SELECT Statements

- Using the UNION operator, display the location ID, department name, and the state where it is located.
- You must match the data type (using the TO\_CHAR function or any other conversion functions) when columns do not exist in one or the other table.

```
SELECT location_id, department_name "Department",
    TO_CHAR(NULL) "Warehouse location"
FROM departments
UNION
SELECT location_id, TO_CHAR(NULL) "Department",
    state_province
FROM locations;
```

### Matching the SELECT Statement: Example

Using the UNION operator, display the employee ID, job ID, and salary of all employees.

```
SELECT employee_id, job_id,salary
FROM employees
UNION
SELECT employee_id, job_id,0
FROM job_history;
```

	EMPLOYEE_ID	JOB_ID	2 SALARY
1	100	AD_PRES	24000
2	101	AC_ACCOUNT	0
3	101	AC_MGR	0
4	101	AD_VP	17000
5	102	AD_VP	17000
29	205	AC_MGR	12000
30	206	AC ACCOUNT	8300

- Set Operators: Types and guidelines
- Tables used in this lesson
- UNION and UNION ALL operator
- INTERSECT operator
- MINUS operator
- Matching the SELECT statements
- Using the ORDER BY clause in set operations

### Using the ORDER BY Clause in Set Operations

- The ORDER BY clause can appear only once at the end of the compound query.
- Component queries cannot have individual ORDER BY clauses.
- ORDER BY clause recognizes only the columns of the first SELECT query.
- By default, the first column of the first SELECT query is used to sort the output in an ascending order.

#### Quiz

Identify the set operator guidelines.

- 1. The expressions in the SELECT lists must match in number.
- 2. Parentheses may not be used to alter the sequence of execution.
- The data type of each column in the second query must match the data type of its corresponding column in the first query.
- 4. The ORDER BY clause can be used only once in a compound query, unless a UNION ALL operator is used.

### **Summary**

In this lesson, you should have learned how to use:

- UNION to return all distinct rows
- UNION ALL to return all rows, including duplicates
- INTERSECT to return all rows that are shared by both queries
- MINUS to return all distinct rows that are selected by the first query, but not by the second
- ORDER BY only at the very end of the statement

#### **Practice 8: Overview**

In this practice, you create reports by using:

- The UNION operator
- The INTERSECTION operator
- The MINUS operator
